Osteoporosis

Early Detection Device of Osteoporosis

Osteoporosis is an expression called on a lack of a normal bone density and change in composition with age. In the case of osteoporosis the pores in the bone decrease, the bones become more brittle and lose its natural hardness. Therefore, bone can break very easily in patients with osteoporosis especially the bones of the hip, thigh, forearm, as well as the spine. Accurate diagnosis of this disease is done by measuring bone density. It is a special type of X-ray imaging which measure bone density. This examination does not cause any pain and take between five to ten minutes. The best and latest device is available in Al-Hayat Medical centers.
